Bumm Bumm Exchange

A space where we could more openly exchange about e.g. "Where to source AS3310 ICs in the US?" or I could less effortlessly feedback panel designs with you (compared to communicating via email).

What is your stake in this idea, and what channel would you prefer?

Where would you join this exchange space? *

What else do you want me to know me about this matter?

14 answers

- Discord is most common platform and is very easy to use.
- Discord makes most sense. We all are probably already in Kristians and Juanitos so have the capability already.
- Discord or Slack have been my go-to platforms for organizing project work but I'm happy to work within whatever you happen to choose.
- I'm pretty much a noob as well when it comes to discord but I've set it up before once or twice. I also love reddit, that's how I learned of you, do I am open to whatever you come with. Participation is awesome and collaboration feels good.

- Seems /r/synthdiy/ could get out of hand. something like /r/bummbummbeta or similar could allow aggregating feedback by device... Github may also be an option with the added benefit of allowing hosting open code `(\^_o)/`
- Discord would do the job best!
- Capital idea
- Great idea, creating a community for this has lots of possibilities, could be helpful for group orders of pcbs or components to keep prices down too! I'm all for it
- I don't know anything at all about Discord but if I have to I could figure it out. I think you should really consider Modwiggler for the sake of continuity and future accessibility to the documentation - Reddit is pretty shit at those specific things.
- Discord is a great community space! I may not join right away, I'm a bit busy right now, but I'll join eventually. I have several other niche hobby communities in Discord. If you do start a server, consider setting office hours of some kind to manage expectations. Global communities look for help at all hours and sometimes people get frustrated when nobody is around. Showing a message about when people can expect help can reduce frustration. Once your Discord numbers start climbing, appoint a few trusted moderators to help manage spam. If you are sharing your Discord server link, bots or spammers will join at random and you will want to ensure that someone is around to help manage posts and users. Get as much timezone coverage as possible.
- Would rather do reddit since that is more open and easier to access for people without needing an app
- I don't have much experience with Discord, but it seems like a good platform for community discussion.
- I didn't tick Discord, although I'd begrudgingly join in if it were the only option. For me, it's the least usable of the options. I find Discord confusing, it's impossible to keep up with notifications, and conversations are hidden from a web search. I think Reddit is far more appropriate.
- I think a dedicated server is the right idea. I would also do reddit, but I am not that versed in the reddit world.
